

*M. Weintraub and
F. Tip*

TESTING STRATEGIES

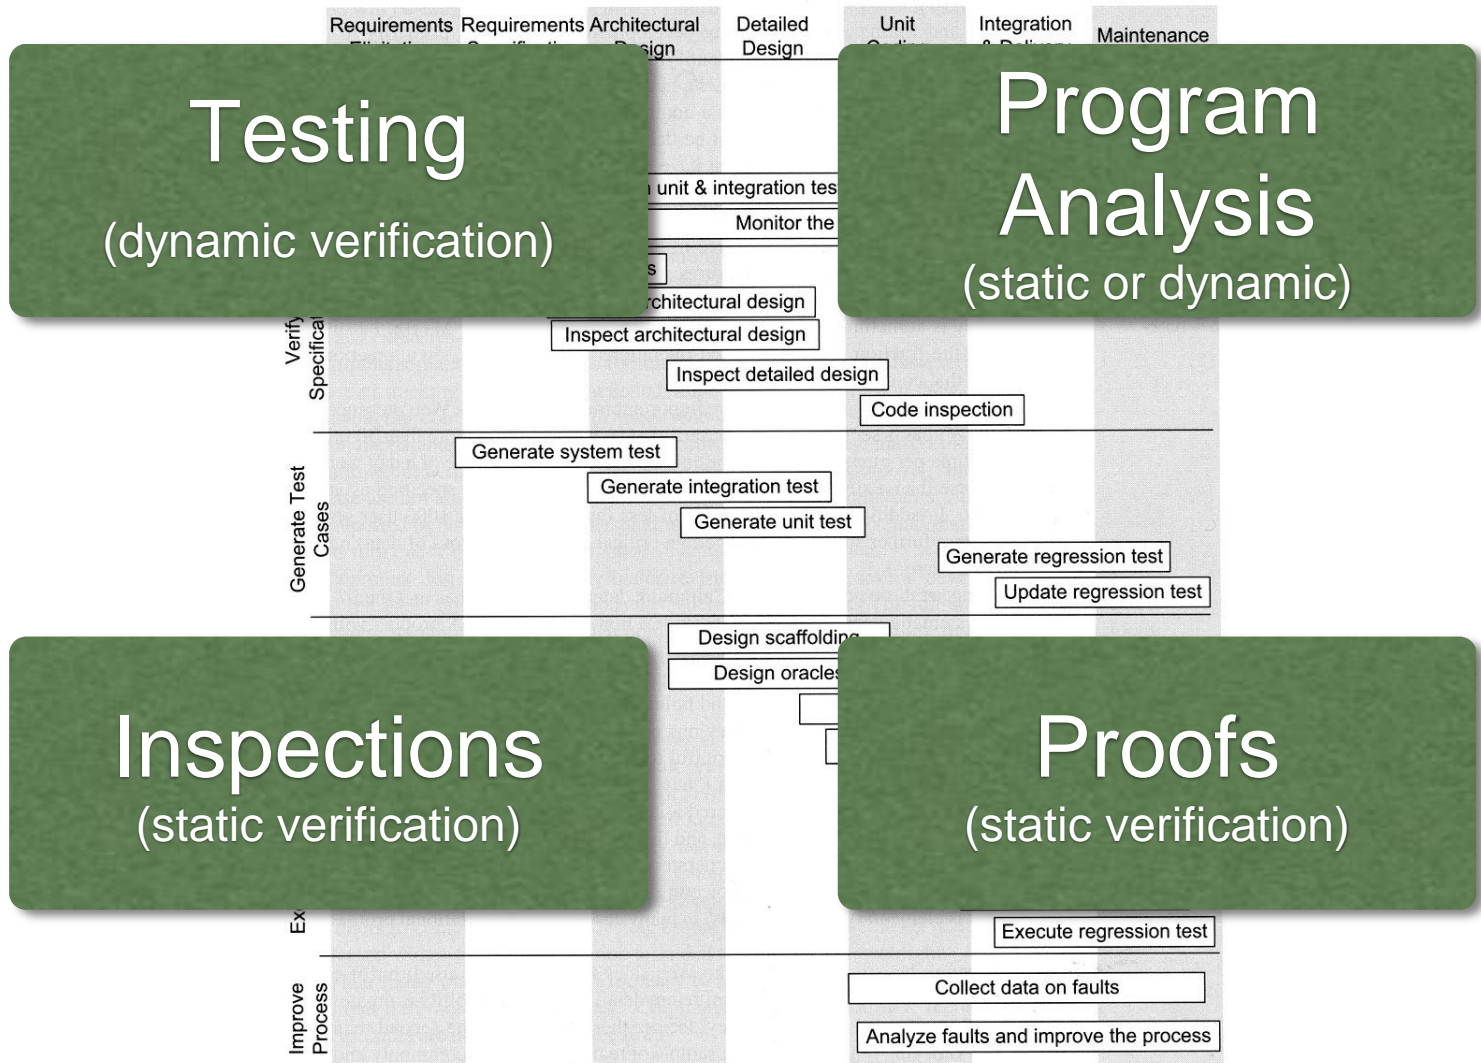

Thanks go to Andreas Zeller for allowing
incorporation of his materials

TESTING

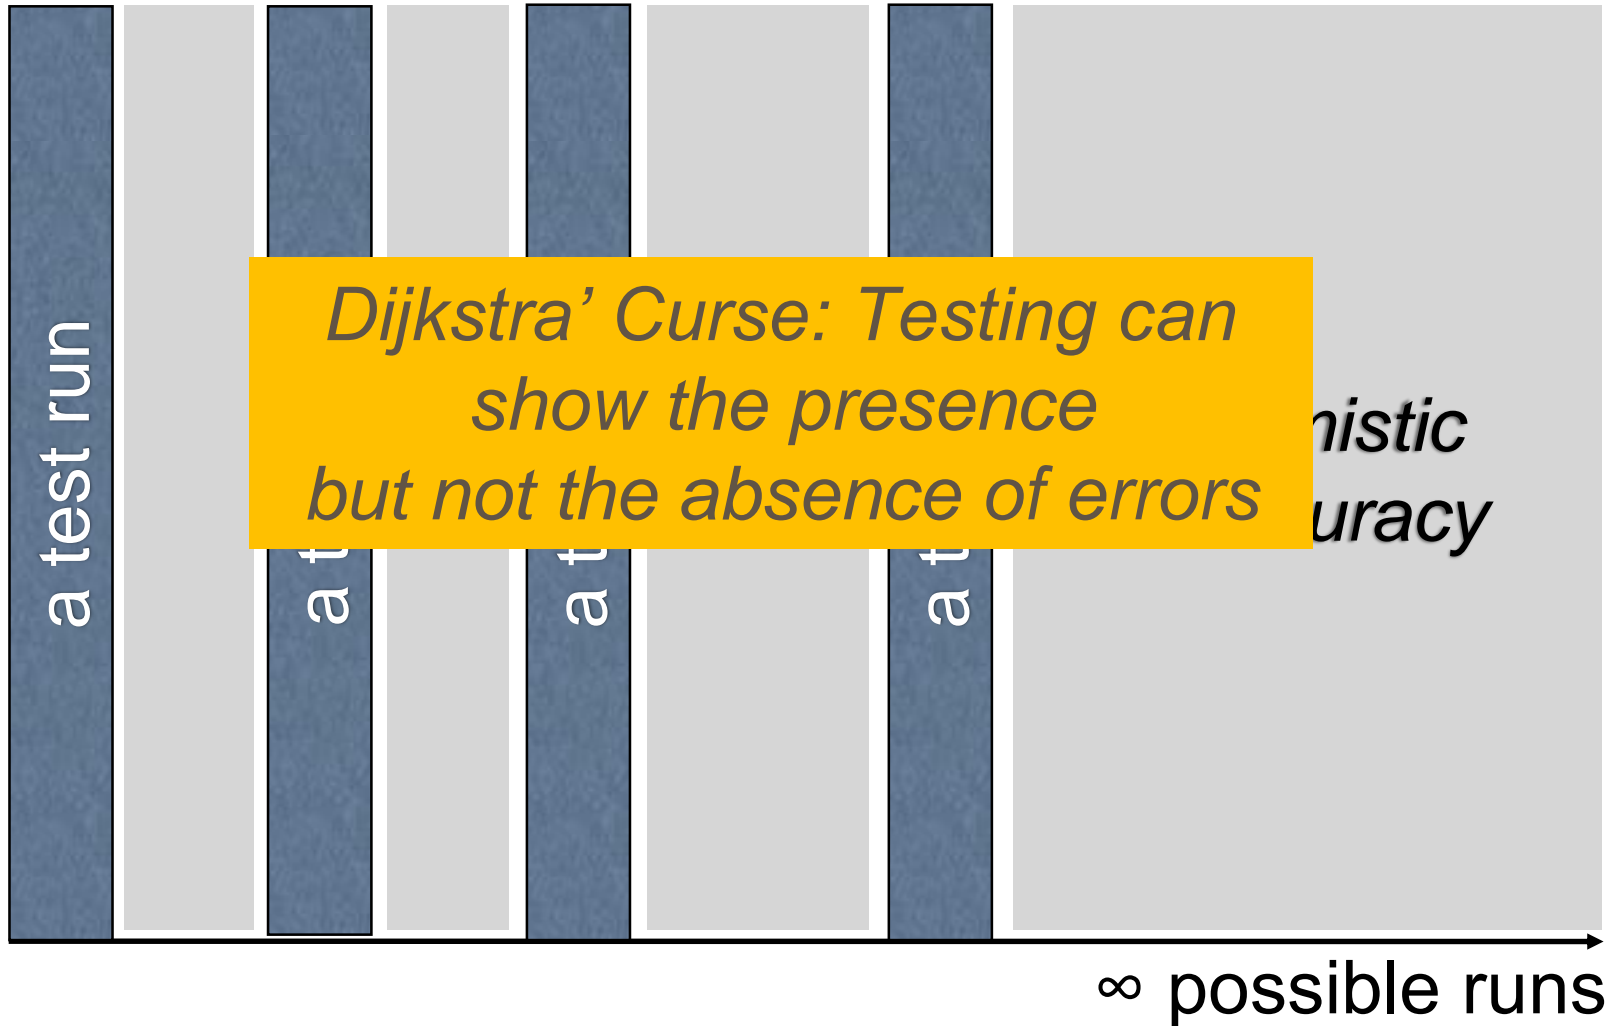

- ★ **Testing:** a procedure intended to establish the quality, performance, or reliability of something, esp. before it is taken into widespread use

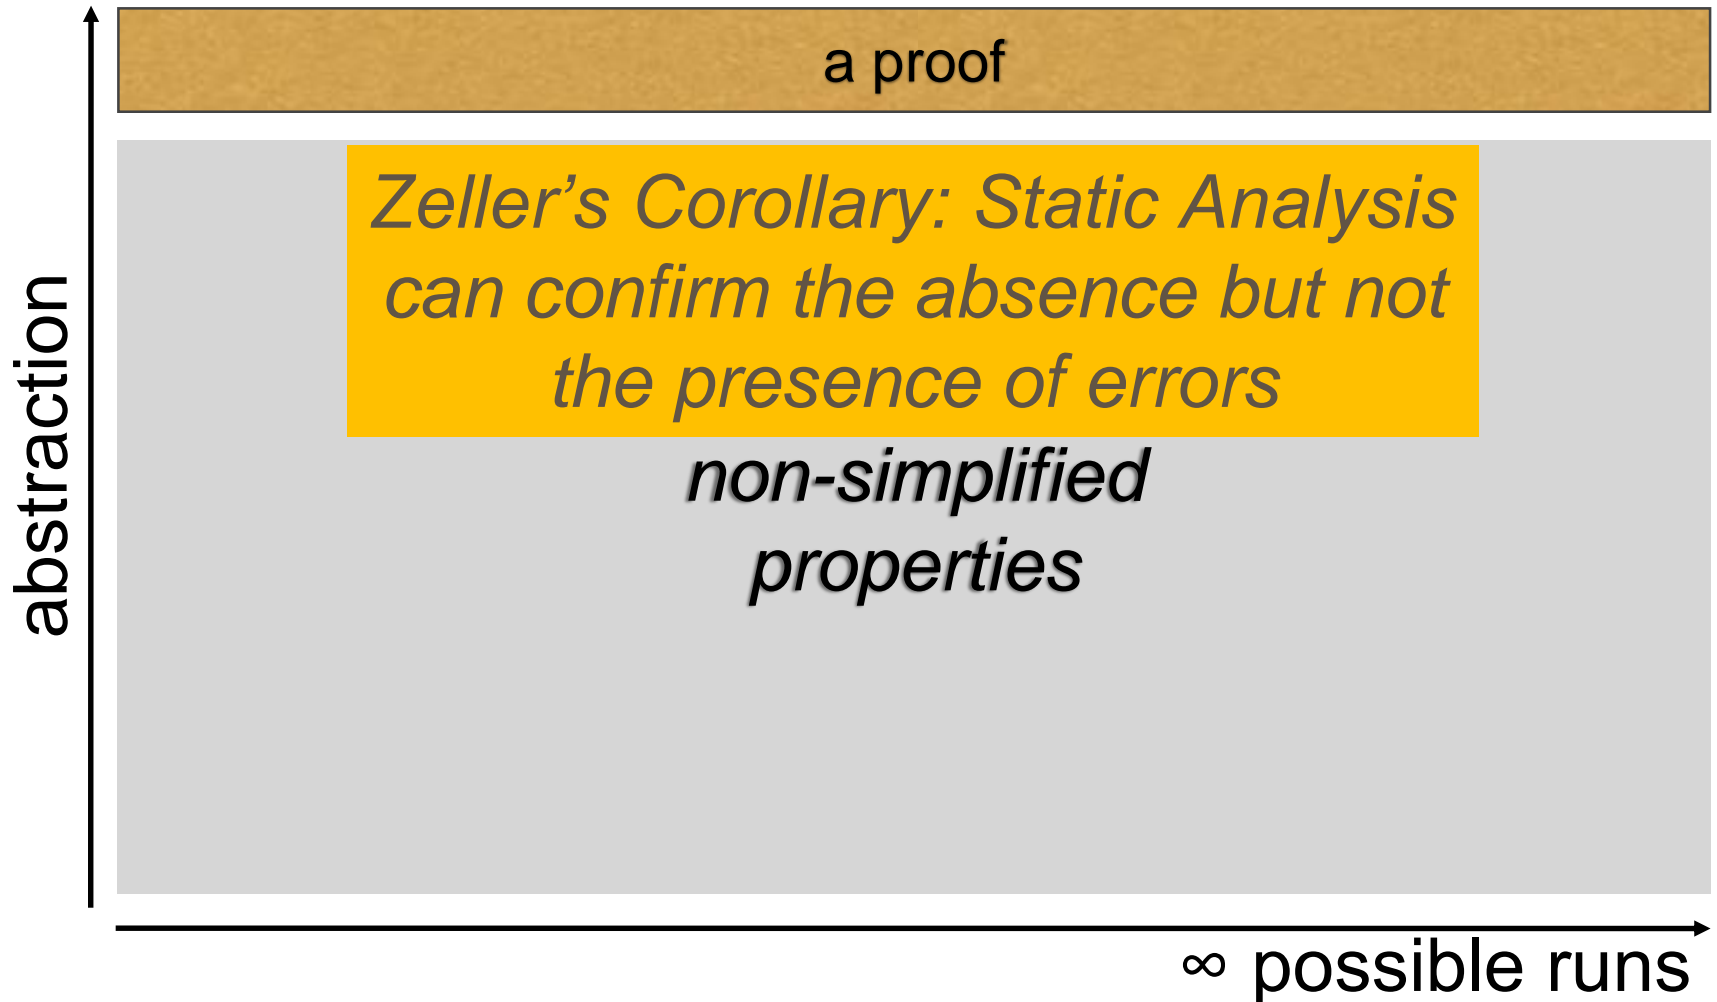

RECALL FROM BEFORE – THESE ARE OUR TECHNIQUES FOR EVALUATING SOFTWARE

THE CURSE OF FUNCTIONAL TESTING

ITS STRUCTURAL TESTING COROLLARY

COMBINING METHODS

WHY IS SOFTWARE VERIFICATION HARD?

- ✦ Many different quality requirements
- ✦ Evolving (and deteriorating) structure
- ✦ Inherent non-linearity
- ✦ Uneven distribution of faults

WHY IS SOFTWARE VERIFICATION HARD?

- ✦ Many different quality requirements
- ✦ Evolving (and deteriorating) structure
- ✦ Inherent non-linearity
- ✦ Uneven distribution of faults

If an elevator can safely carry a load of 1000 kg, it can also safely carry any smaller load

```
/* some info output on file handle */
OUTPUT_BYTE(order1); //some bytes
OUTPUT_BYTE(order2); //some bytes
OUTPUT_BYTE(1); //size of symbols in words
//output upper byte then upper byte
OUTPUT_BYTE(h>>BYTE_SIZE);
OUTPUT_BYTE(l);
OUTPUT_BYTE(w>>BYTE_SIZE);
OUTPUT_BYTE(w);

order1 = order>>4;
order2 = order & 15;

#ifdef TRACE
if (!(fpm = fopen("ppmenc.doc", "wb"))
{
    fprintf(stderr, "\n Error: Can't open file\n");
    exit(2);
}
#endif

/* allocate 'order1' elements
... is used to store
```

WHY IS SOFTWARE VERIFICATION HARD?

- ✦ Many different quality requirements
- ✦ Evolving (and deteriorating) structure
- ✦ Inherent non-linearity
- ✦ Uneven distribution of faults

If an elevator can safely carry a load of 1000 kg, it can also safely carry any smaller load

If a procedure correctly sorts a set of 256 elements, it may fail on a set of 255 or 53 elements, as well as on 257 or 1023

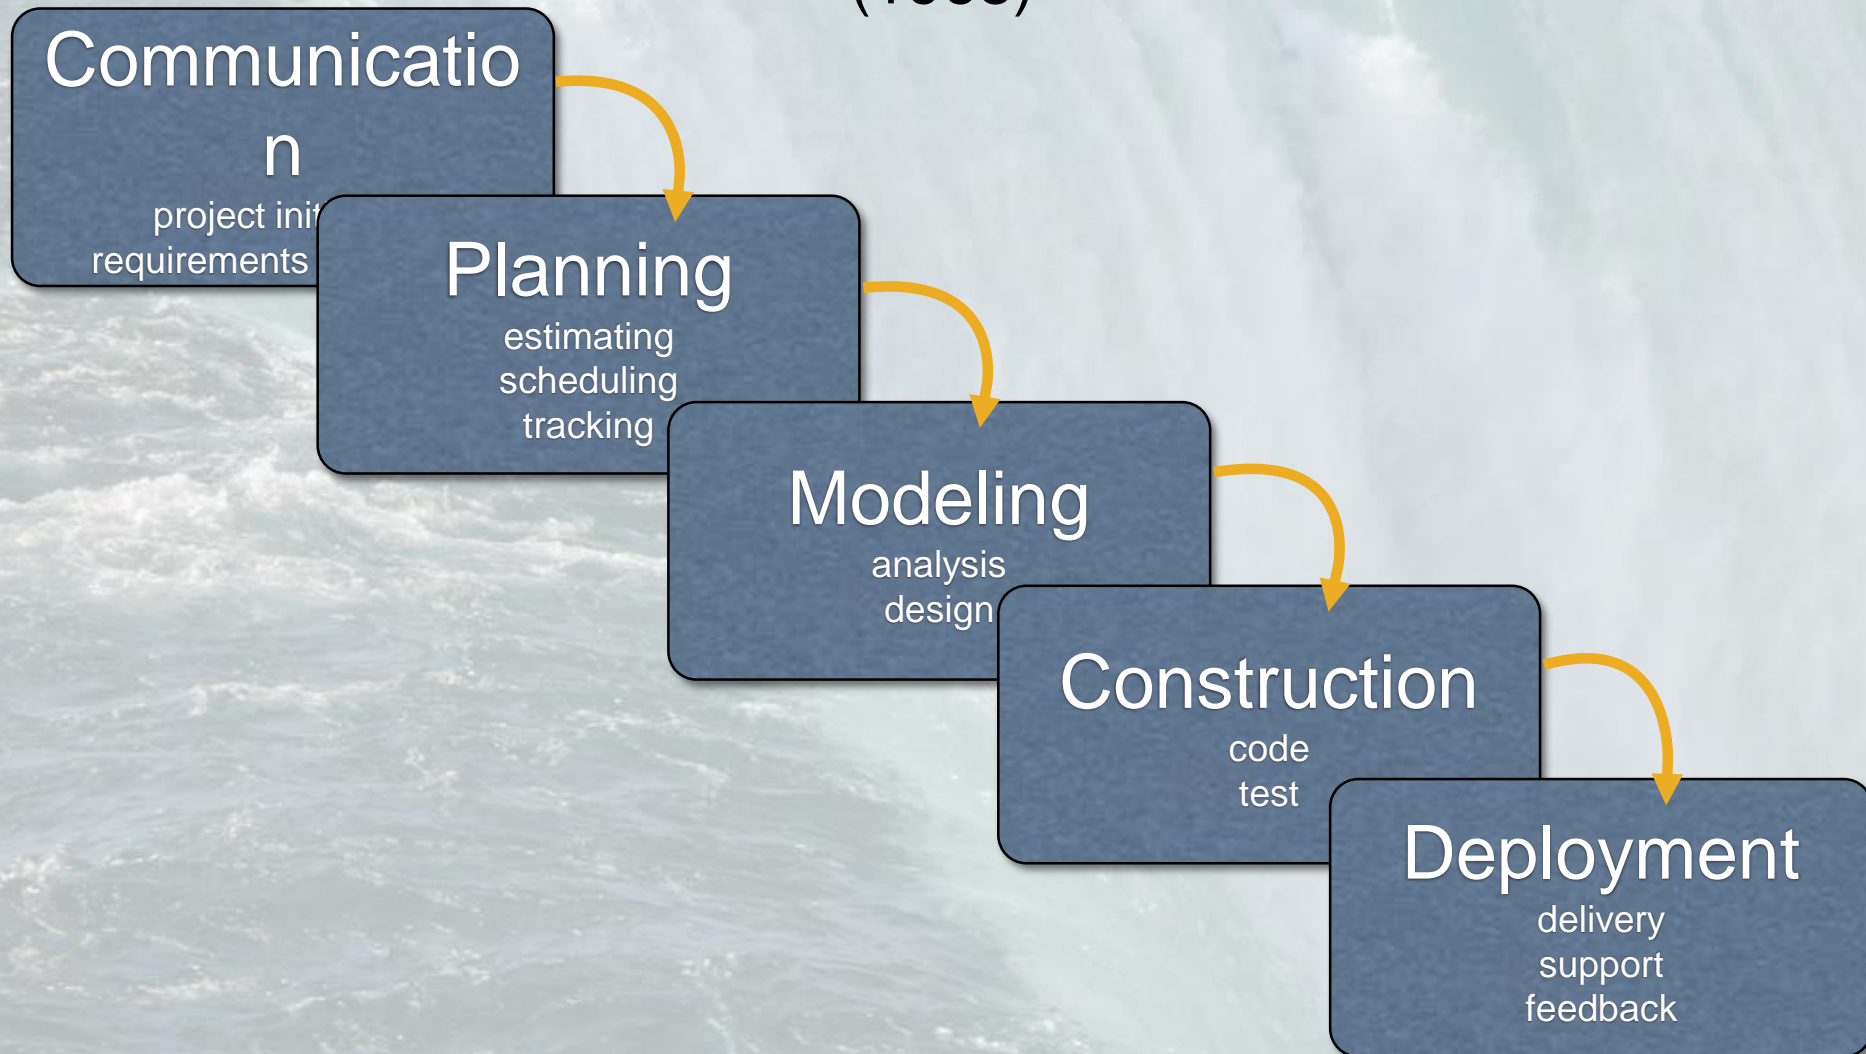

A TESTING PROGRAM INVOLVES TRADE-OFFS

- ✦ We can be inaccurate (optimistic or pessimistic)
- ✦ or we can simplify properties...
- ✦ but you cannot have it all!

Waterfall Model

(1968)

Waterfall Model

(1968)

Communication

project initiation
requirements gathering

Planning

estimating
scheduling
tracking

Modeling

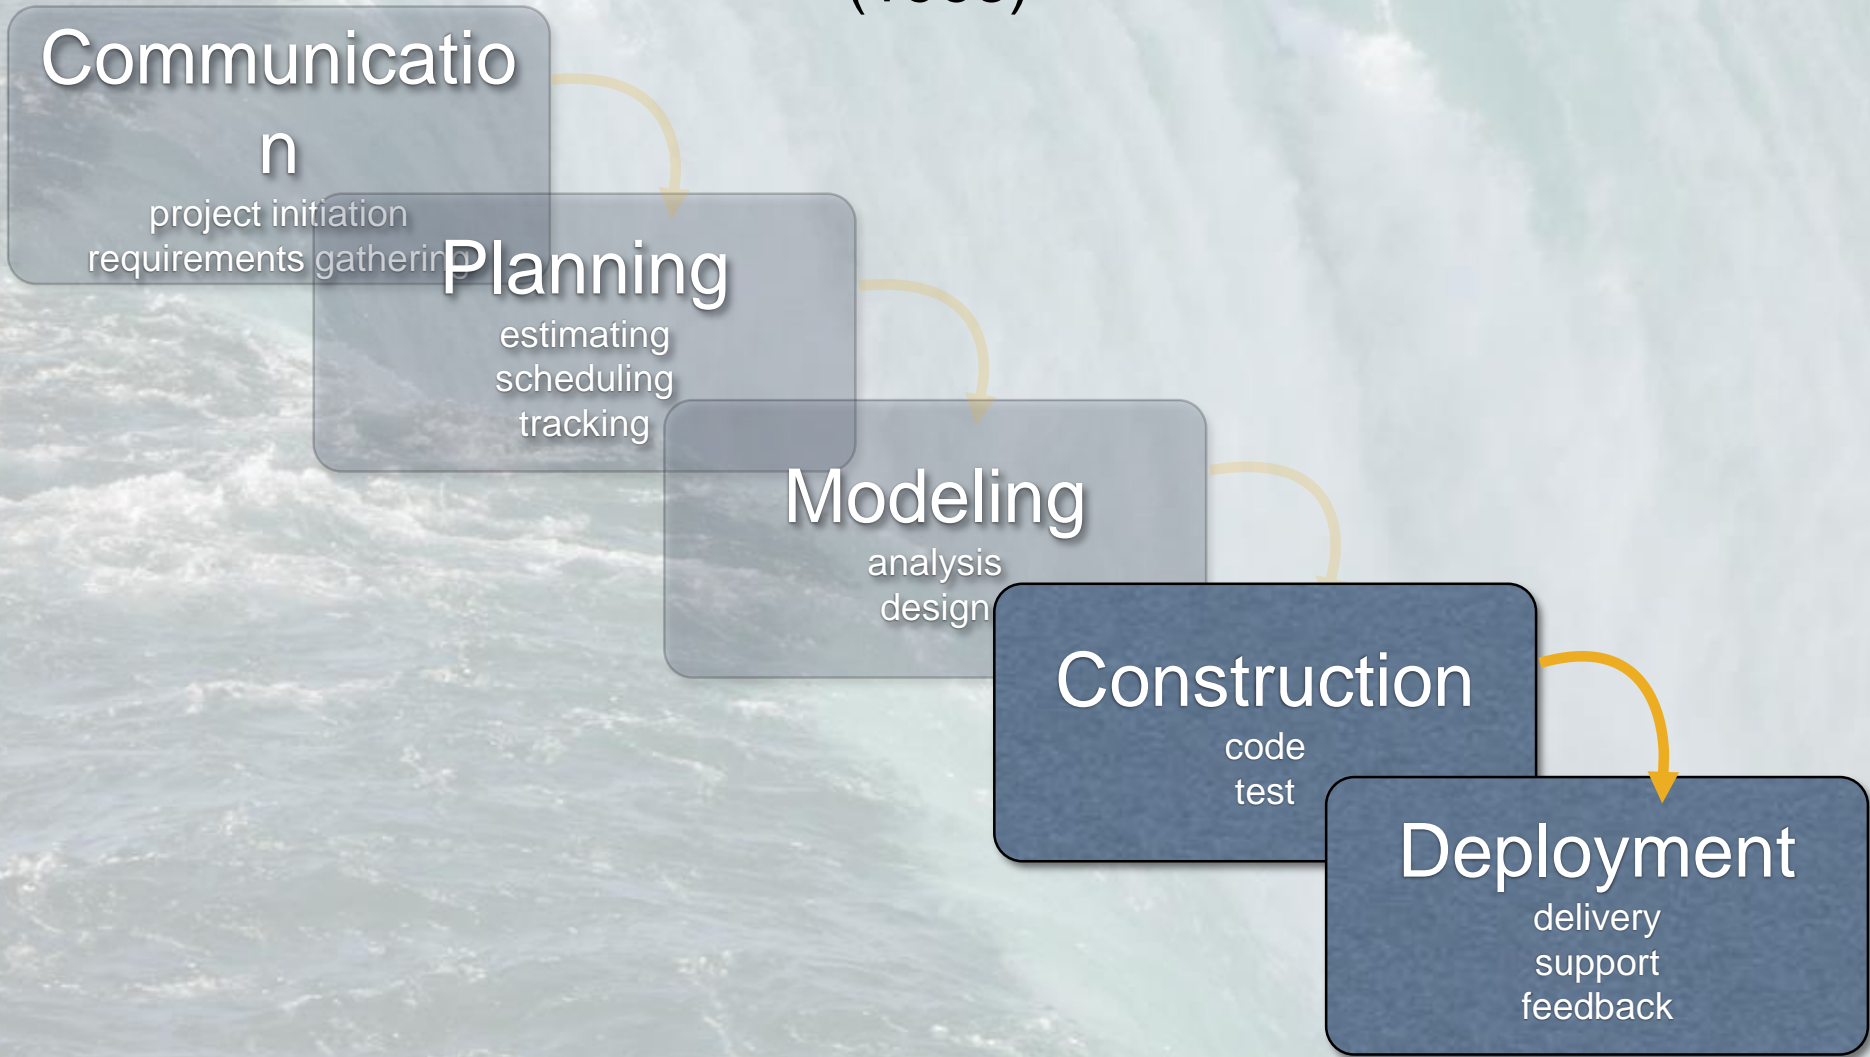

analysis
design

Construction

code
test

Deployment

delivery
support
feedback

We built it!

Shall we deploy it?

feedback

V & V

Validation

Ensuring that software has been built according to customer requirements

Are we building the right product or service?

Verification

Ensuring that software correctly implements a specific function

Are we building the product or service right?

VALIDATION AND VERIFICATION

Category	Description	High Level	Mid Level	Low Level
Business	A business plan for the development			
Requirements	Requirements for the development			
Architecture	Architecture of the system			
Software	Software requirements			
Hardware	Hardware requirements			
System	System requirements			
Integration	Integration requirements			
Performance	Performance requirements			
Security	Security requirements			
Reliability	Reliability requirements			
Flexibility	Flexibility requirements			
Interoperability	Interoperability requirements			
Compliance	Compliance requirements			
Accessibility	Accessibility requirements			
Localization	Localization requirements			
Internationalization	Internationalization requirements			
Portability	Portability requirements			
Scalability	Scalability requirements			
Extensibility	Extensibility requirements			
Testability	Testability requirements			
Documentation	Documentation requirements			
Configuration	Configuration requirements			
Deployment	Deployment requirements			
Operation	Operation requirements			
Maintenance	Maintenance requirements			
Support	Support requirements			
Training	Training requirements			
Handover	Handover requirements			
Disaster Recovery	Disaster Recovery requirements			
End of Life	End of Life requirements			
Other	Other requirements			

Actual
Requirements

Validation

Involves usability testing, user feedback, & product trials

Verification

Includes testing, code inspections, static analysis, proofs

VALIDATION

“if a user presses a request button at floor i , an available elevator must arrive at floor i soon”

not verifiable, but validatable

VERIFICATION

“if a user presses a request button at floor i , an available elevator must arrive at floor i **within 30 seconds**”

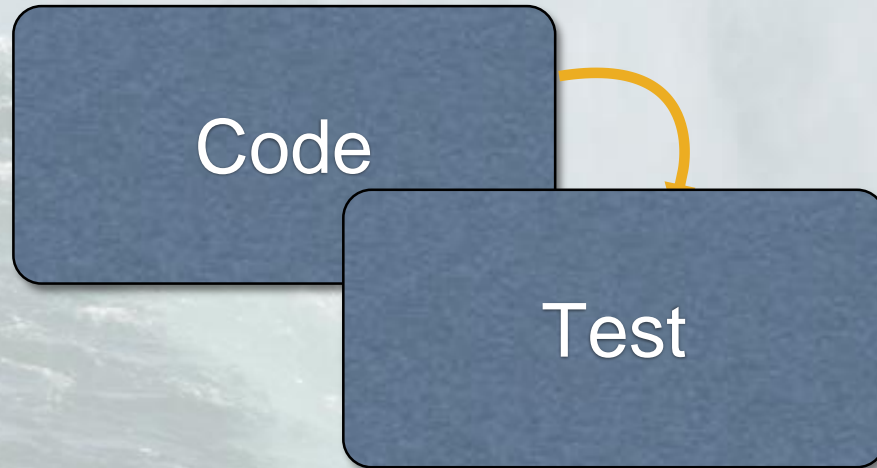

verifiable

CORE QUESTIONS

- ✦ When does V&V start? When is it done?
- ✦ Which techniques should be applied?
- ✦ How do we know a product is ready?
- ✦ How can we control the quality of successive releases?
- ✦ How can we improve development?

Waterfall Model

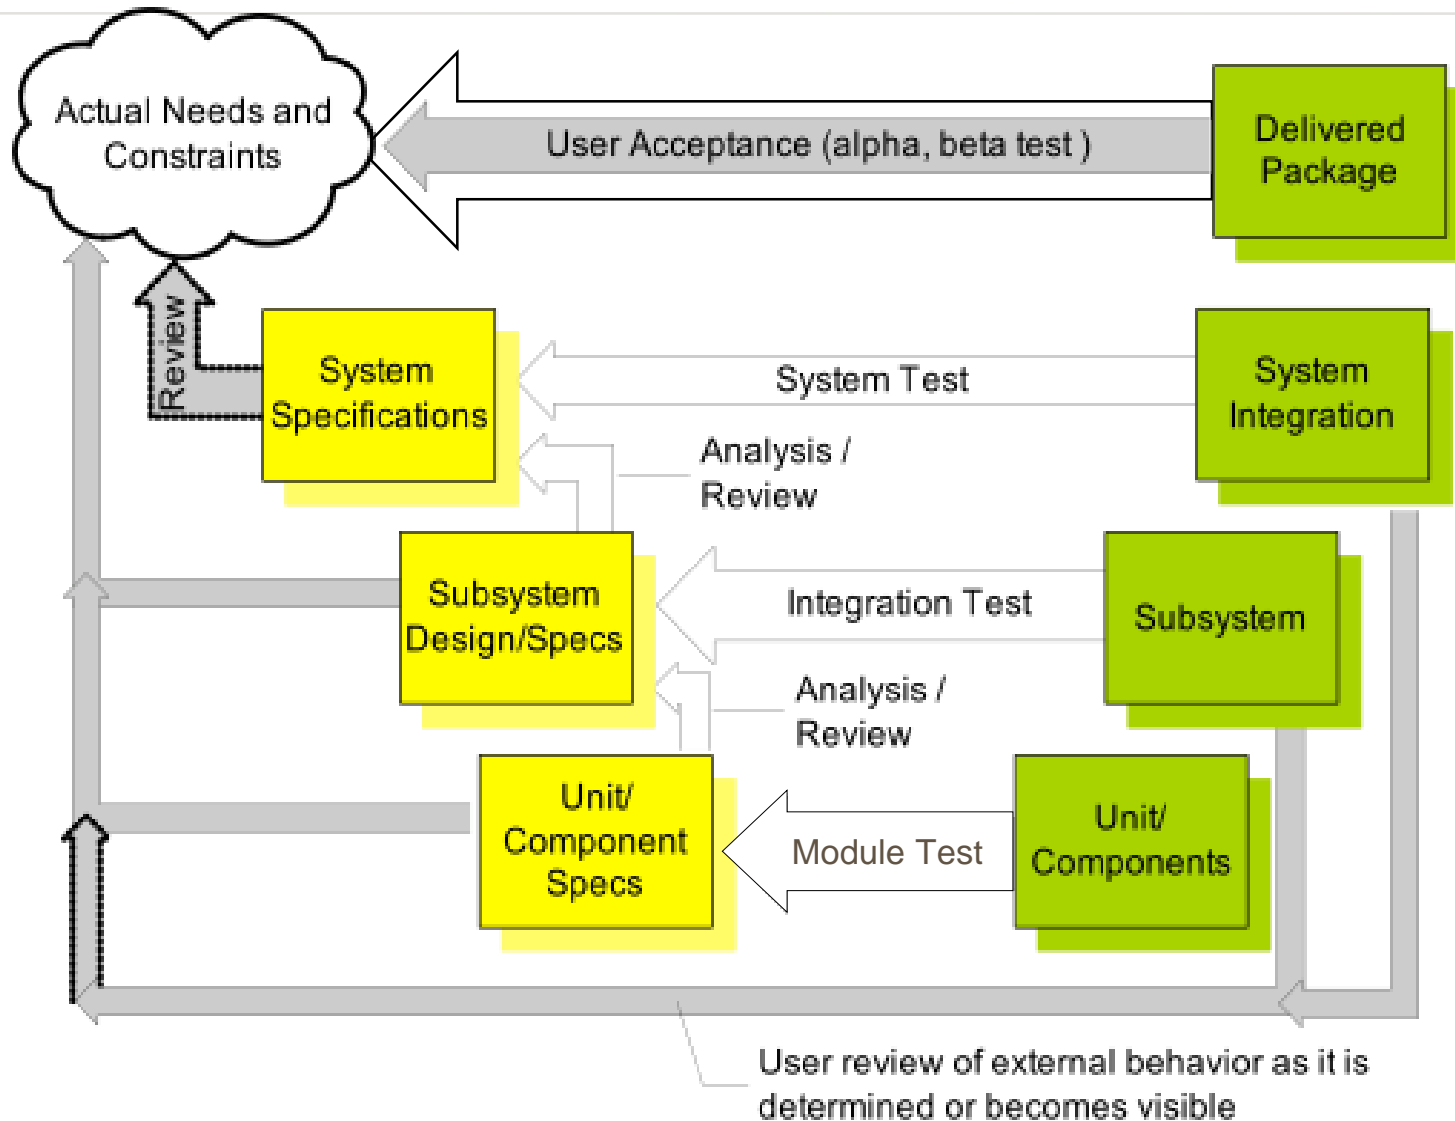

(1968)

FIRST CODE, THEN TEST

1. Developers on software should do testing all
2. Software should be “tossed over the wall” to strangers who will test it mercilessly
3. Testers should get involved with the project only when testing is about to begin

V MODEL

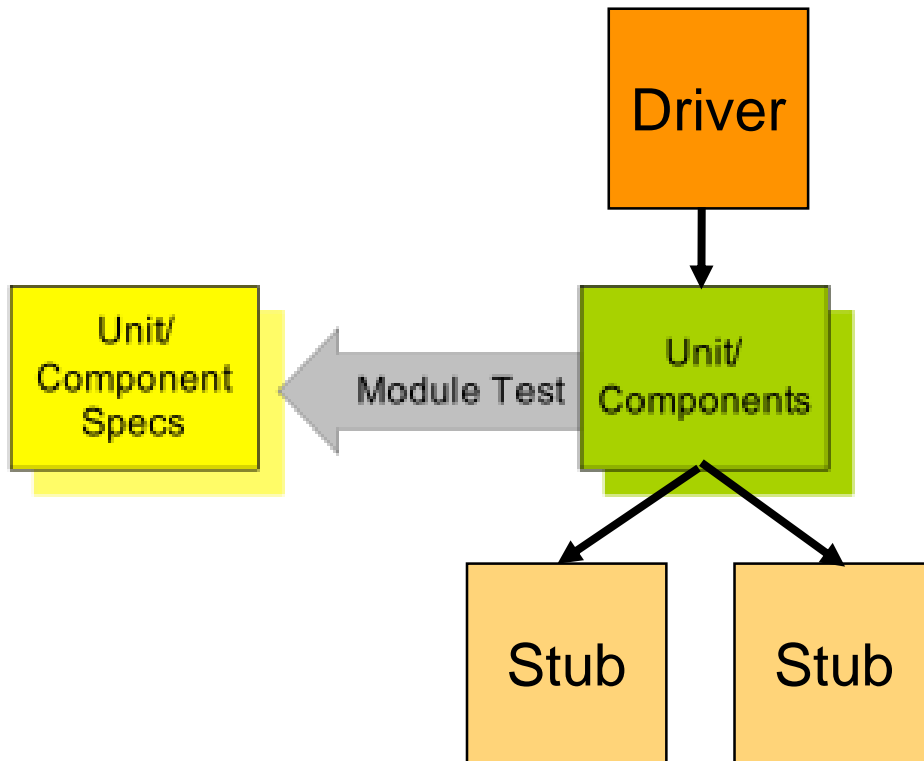

UNIT TESTS

- ✦ Aims to uncover errors at module boundaries
- ✦ Typically written by programmer herself
- ✦ Should be completely automatic (→ regression testing)

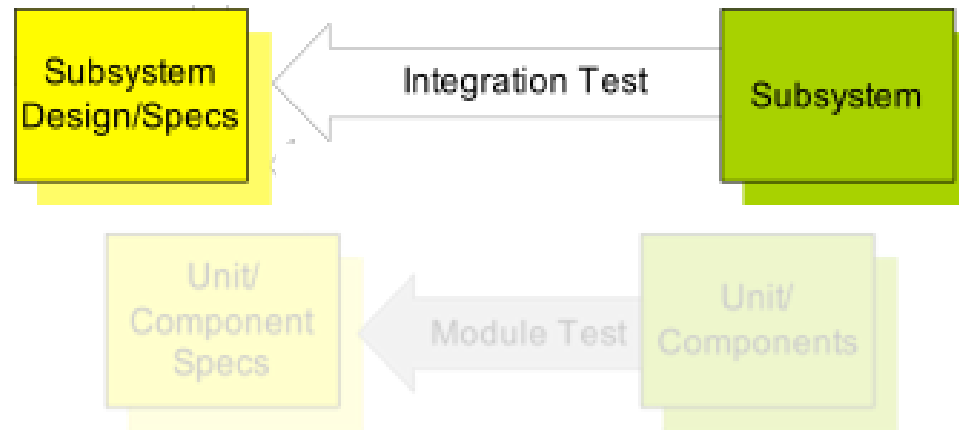

TESTING COMPONENTS: STUBS AND DRIVERS

- ✦ A *driver* exercises a module's functions
- ✦ A *stub* simulates not-yet-ready modules
- ✦ Frequently realized as *mock objects*

PUTTING THE PIECES TOGETHER: INTEGRATION TESTS

- ✦ General idea: *Constructing software while conducting tests*
- ✦ Options: Big Bang or Incremental Construction

BIG BANG APPROACH

All components are combined
in advance

The entire program is tested
as a whole

BIG BANG APPROACH

All components are combined
in advance

The entire program is tested
as a whole

CHAOS RESULTS!

For every failure, the entire program must be taken into
account

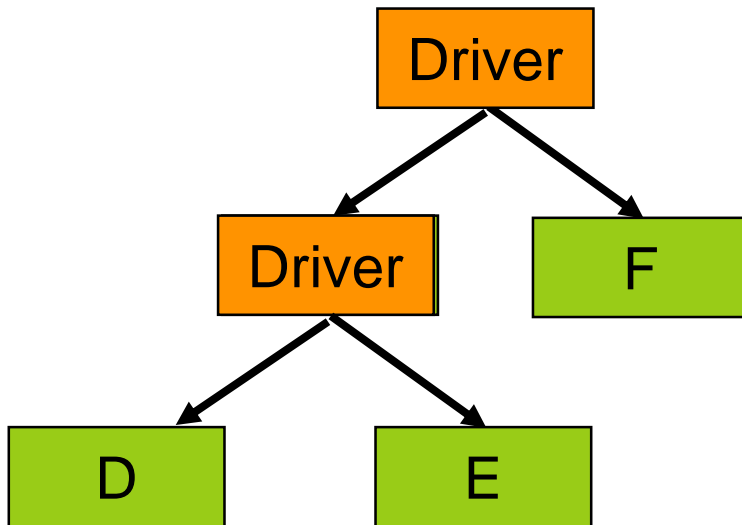

TOP-DOWN INTEGRATION

- ★ Top module is tested with stubs (and then used as driver)
- ★ Stubs are replaced one at a time (“depth first”)
- ★ As new modules are integrated, tests are re-run

Allows for early demonstration of capability

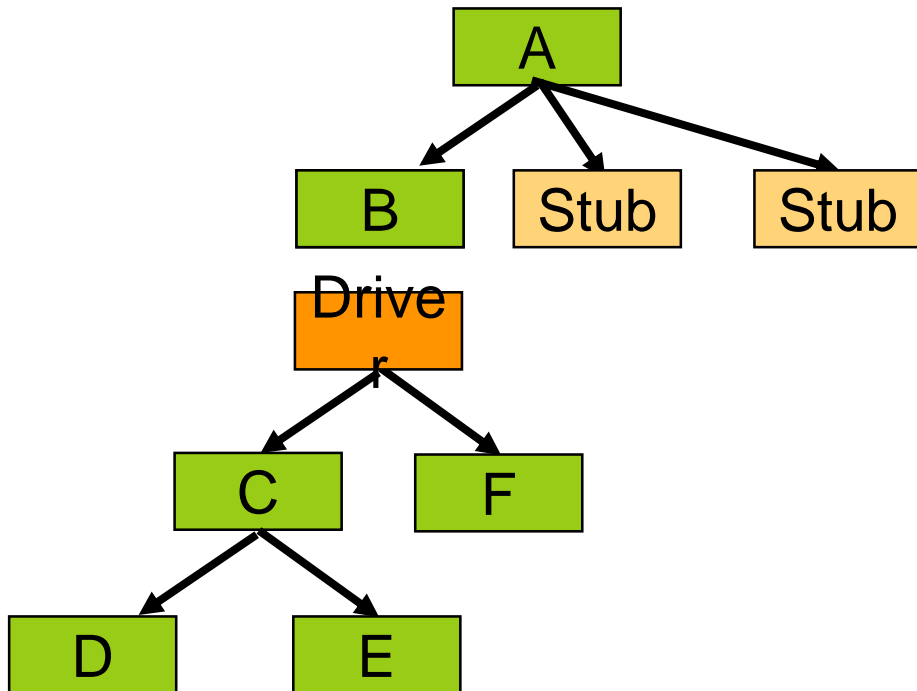

BOTTOM-UP INTEGRATION

- ✦ Bottom modules implemented first and combined into clusters
- ✦ Drivers are replaced one at a time
- ✦ Removes the need for complex stubs

Allows for early demonstration of capability

SANDWICH INTEGRATION

★ Combines bottom-up and top-down integration

★ Top modules tested with stubs, bottom modules with drivers

Combines the best of the two approaches

ONE DIFFERENCE FROM UNIT TESTING: EMERGENT BEHAVIOR

Some behaviors are only clear when components are put together

Usually this is identified after the fact, and causes test suites/cases to be refactored.

WHO TESTS THE SOFTWARE?

Developer

understands the system

but will test gently
driven by delivery

Independent Tester

must learn about system

will attempt to break it
driven by quality

WEINBERG'S LAW

A developer is unsuited to test his or her code.

EVERYONE IS A TESTER!

✦ Experienced Outsiders and Clients

- ✦ Good for finding gaps missed by developers, especially domain specific items

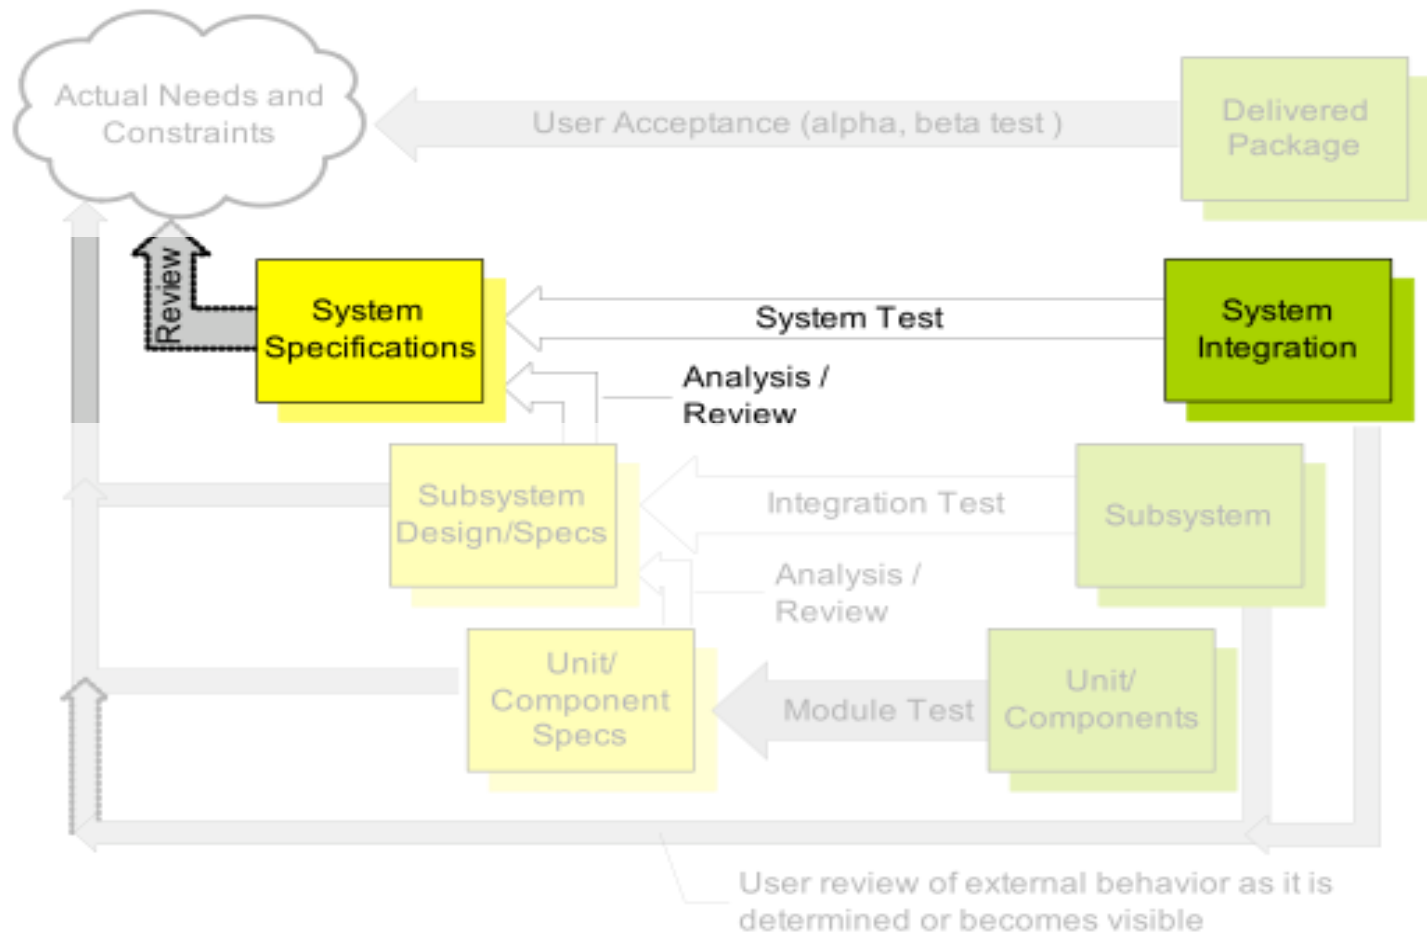

✦ Inexperienced Users

- ✦ Good for illuminating other, perhaps unintended uses/errors

✦ Mother Nature

- ✦ Crashes tend to happen during an important client/customer demo...

SYSTEM TESTING

SPECIAL KINDS OF SYSTEM TESTING

✦ **Recovery testing**

forces the software to fail in a variety of ways and verifies that recovery is properly performed

✦ **Security testing**

verifies that protection mechanisms built into a system will, in fact, protect it from improper penetration

✦ **Stress testing**

executes a system in a manner that demands resources in abnormal quantity, frequency, or volume

✦ **Performance testing**

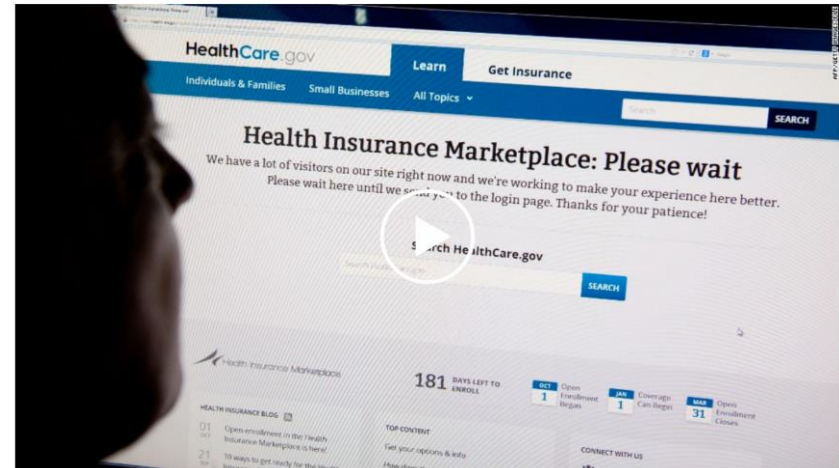

test the run-time performance of software within the context of an integrated system

PERFORMANCE TESTING

Measures a system's capacity to process a specific load over a specific time-span, usually:

1. *number of concurrent users*
2. *specific number of concurrent transactions*

Involves defining and running operational profiles that reflect expected use

TYPES OF PERFORMANCE TESTING

1. Load

Aims to assess compliance with non-functional requirements

2. Stress

Identifies system capacity limits

3. Spike

Testing involving rapid swings in load

4. Endurance (or Soak)

Continuous operation at a given load

MANY OPTIMIZATIONS ARE POSSIBLE

- ✦ For Throughput or Concurrency?
 - ✦ *Getting the most data processed*
 - ✦ *Greatest number of simultaneous transactions*
- ✦ For Server response time?
- ✦ For Service request round-trip time?
- ✦ For Server utilization?
- ✦ For End-User Experience?
- ✦ For Cost?

SECURITY TESTING

✦ Confidentiality

- ✦ Information protection from unauthorized access or disclosure

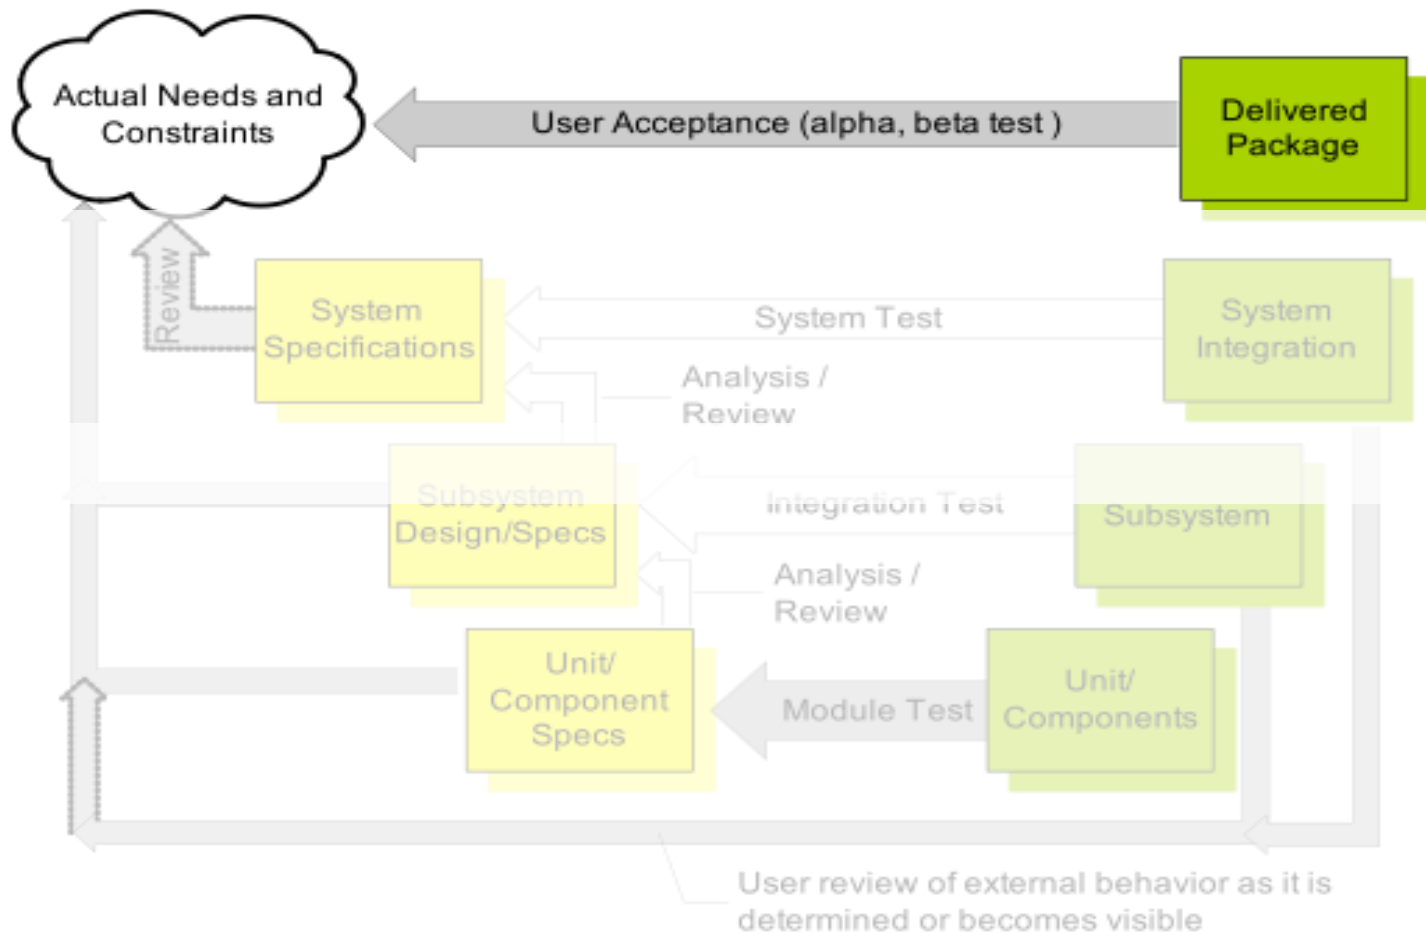

✦ Integrity

- ✦ Information protection from unauthorized modification or destruction

✦ Availability

- ✦ System protection from unauthorized disruption

ACCEPTANCE TESTING

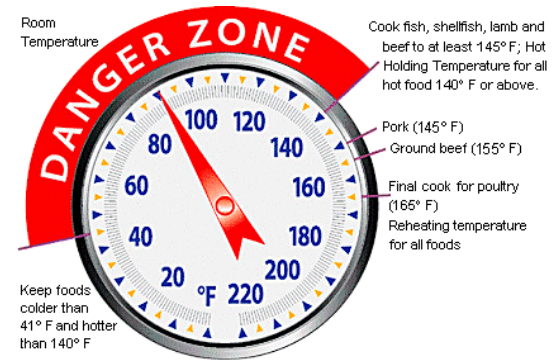

ACCEPTANCE TESTING

- ✦ Acceptance testing checks whether contractual requirements are met
- ✦ May be incremental
 - ✦ Alpha / Beta
- ✦ Work is over when acceptance testing is done

HOW DO WE KNOW WHEN A PRODUCT IS READY?

✦ Let the customer test it :-)

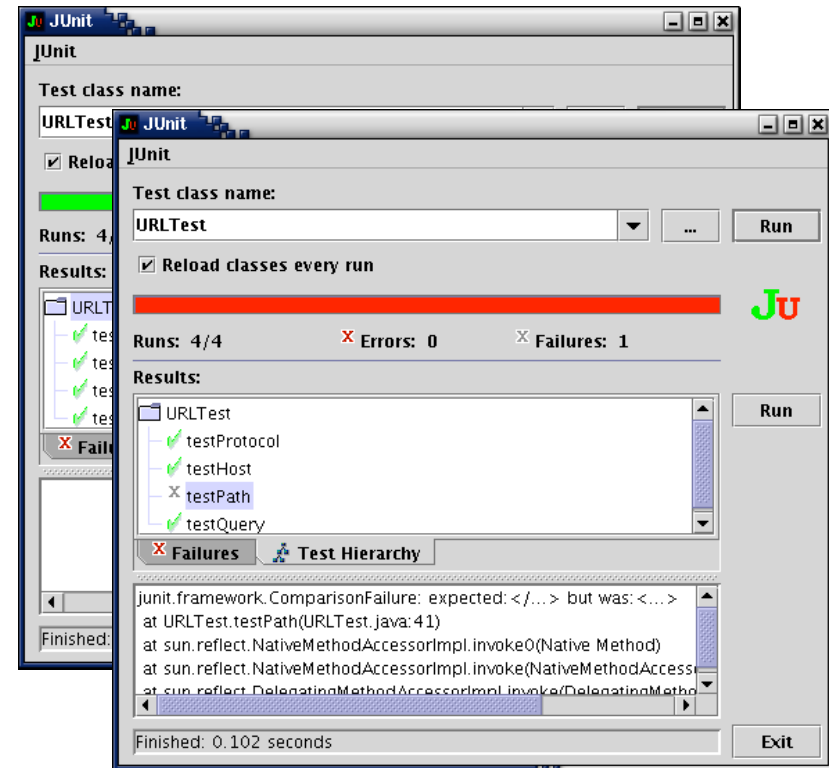

✦ We're out of time...

✦ Relative to a theoretically sound and experimentally validated statistical model, we have done sufficient testing to conclude with 95% confidence that the probability of 1,000 CPI's of failure-free operation is ≥ 0.995 .

This is the type of argument we aim for.

REGRESSION TESTS

- ◆ set up automated tests
 - ◆ using, e.g., JUnit
- ◆ ideally, run regression tests after each change
- ◆ if running the tests takes too long:
 - ◆ prioritize and run a subset
 - ◆ apply regression test selection to determine tests that are impacted by a set of changes

REMEMBER PARETO'S LAW

**Approximately 80% of defects
come from 20% of modules**

CORE QUESTIONS

✦ When does V&V start? When is it done?

✦ Which techniques should be applied?

✦ How do we know a product is ready?

✦ How can we control the quality of successive releases?

✦ How can we improve development?

BEST PRACTICES

- ✦ Specify requirements in a quantifiable manner
- ✦ State testing objectives explicitly
- ✦ Understand the users of the software and develop a profile for each user category
- ✦ Develop a testing plan that emphasizes “rapid cycle testing”

BEST PRACTICES

- ✦ Build “robust” software that is designed to test itself
- ✦ Use effective formal technical reviews as a filter prior to testing
- ✦ Conduct formal technical reviews to assess the test strategy and test cases themselves
- ✦ Develop a continuous improvement approach for the testing process

DESIGN FOR TESTING

- ✦ OO design principles also improve testing
 - ✦ Encapsulation leads to good unit tests
- ✦ Provide diagnostic methods
 - ✦ Primarily used for debugging, but may also be useful as regular methods
- ✦ Assertions are great helpers for testing
 - ✦ Test cases may be derived automatically
